# Assignment Project Exam Help Assignment Project Exam Help Abstract Data Types

https://powcoder.com

Add WeChat powcoder

#### Abstract Data Types

- A data type represents a set of values (think of int, char, etc)
- Assignment type (AD) represents a set of values and operations but does not specify any implementation for those operations.
  - Mttpse rakpotwood of the mainers.
  - A container, or collection, stores a number of data of the same type. Containers are inevitable in almost all semi-serious programming types (net la maty programming) of the lambda of the same type.
  - We've seen some already: arrays, Inked lists, maps, etc.
  - We'll study some other common instances of them, and introduce C++ Templates along the way.

#### A Simple Container

#### Arrays vs. Linked Lists:

- The nth element in an array can be accessed by a[n], while
- Assignment Project Exam Help
  - Linked lists are flexible in size; arrays are fixed-size.

Lets make a best-of-both:

https://powcoder.com

count : int

capacity: int

Addio entinat powcoder

operator[](int index) : int&

append(int value) : void

ensureCapacity(int cap) : void

compact() : void

```
class ExtendableIntArray {
     int _count, _capacity;
     int* store;
Assignment Projects Exam Help
        newStore[i] = store[i];
    https://powcoder.com
    ExAndde We Chat powcoder
      _{count} = 0;
      _capacity = cap;
      store = new int[cap];
```

```
virtual ~ExtendableIntArray() {
 delete[] store;
    ment Project Exam Help
 return _count;
   tps://powcoder.com
 return _capacity;
}
inAddatWjeChat, powcoder
 return store[index];
```

```
const int& operator[](int index) const {
       return store[index];
     void ensureCapacity(int cap) {
       if (_capacity < cap) {</pre>
Assignment Project Exam Help
     v.https://powcoder.com
       ensureCapacity(_count + 1);
       store[_count++] = value;
             WeChat powcoder
     void compact() {
       if (_capacity > _count) {
         _capacity = _count; resizeStore();
```

	Action	Count	Cap.	Contents						
	ExtendableIntArray arr(5)	0	5							
	arr.append(1)arr.append(5)	• 5	5	1, 2, 3, 4, 5	1					
S	Stemment Pro	)1 <del>@</del> C		хат Не	ln					
_	$\operatorname{arr}[2] = 30$	6	11	1, 2, 30, 4, 5, 6	-1					
	arr.ensureCapacity(50)	6	95	1, 2, 30, 4, 5, 6						
	arr:compact() //	6 7	6	1, 2, 30, 4, 5, 6						
Https://powcoder.com										

What we have achieved:

- An array object with a flexible size!
- · Matthewattpowerder++
- Exercise: Add a crop(int) method to crop the array to specified size
- What do you need to do in that method body?

#### Extendable Double Array

Now we need an extendable double array.

```
Assignment Project Exam Help

store : double[]

operator[](int index) : double&

https://doubledcommunication.com/pacity(int cap) : void

compact() : void
```

### Add We Chat powcoder

#### Class Templates

• A class template is a blueprint from which multiple individual

Assiclasses can be constituted jet the constitute of these classes are written in the template, the differences are reflected as template parameters.

- Templates may take types, constant values and functions as taking \$.//powcoder.com
- Template parameters may be used inside the body of the template.
- Anactual class is ented though incontation of the template. A class template instantiation may appear wherever a type is expected.
- Template instantiation is textual substitution.

To make ExtendableArray class suitable for any data type, we make it into a template:

Assignment Project Exam Help

count: int
capacity: int

https:/powcoder.com
operator[](int index): T&
append(T value): void

Addomnatte Nat powcoder

Addomnatte Nat powcoder

```
template <typename T> //<class T> is also valid
 class ExtendableArray {
ssignment, Project Exam Help
  T* store;
  "https://powcoder.com
    for (int i = 0; i < _count; i++)
     newStore[i] = store[i];
   Add WeChat powcoder
```

```
public:
  ExtendableArray(int cap = 10) {
             nt Project Exam Help
    capacity = cap;
    store = new T[cap];
           s://powcoder.com
ExtendableArray() { delete[] store; }
  int count() const { return _count; }
  int capacity() const { return _capacity; }
  const T& operator[](int index) const {
    return store[index];
```

```
void ensureCapacity(int cap) {
       if (_capacity < cap) {</pre>
        while (_capacity < cap) (_capacity *= 2)++;</pre>
        resizeStore();
Assignment Project Exam Help
     void append(T value) {
      http://powcoder.com
     *AddaWyeChat powcoder
        _capacity = _count; resizeStore();
```

```
ExtendableArray<double> arr(5);
ssignment; Project Exam Help
    arr. append (3.3);
    arr.append(4.4);
    arr.append(5,5); // capacity (5) reached
arranges(6.5) // Where Correction to 11
    arr[2] = 30:
    arAeddeck/cet(spat/powcoder
arr.compact(); // internal store shrunk to s
    return 0;
```

int main() {

Under the hood, when we use ExtendableArray<double>, the compiler instantiates the template into this template class:

```
Assignment Project Exam Help

int _count, _capacity;

double *store;
powcoder.com

void resizeStore() {
```

int \*newStore = new double[\_capacity];
..Add WeChat powcoder

};

#### Advantages and Disadvantages of Class Templates

## Assignation requirement of same program.

- The bad: class templates are not compiled; only when they are instantiated will any compile-time errors be reported.
   The ugy: Because the compiler needs the whole template in
- The ugly. Because the compiler needs the whole template in textual form, we cannot separate the class template definition from class template declaration when compiling (this means: a code of the case file of addition of the case of the compiler needs the whole template in textual form.

#### A Better Container

We will also add two more operations, insert(T, int) and remodeling Somak Detections, insert(T, int) and remodeling Somak Detections and remod

- Appending or inserting to an ExtendableArray at full capacity:
- Removing data from an invalid location: do nothing, return false, throw exception.

```
template < typename T, int MAXCAP = INT_MAX >
class ExtendableArray {
```

# Assignment Project Exam Help

```
ExtendableArray(int cap = 10) {

Intto S / P P W C Oder Com

else if (cap MAXCAP) cap = MAXCAP;

count = 0;

capacity = cap;

Add nW top hat powcoder

}
```

```
// ~ExtendableArray, count(), capacity(),
// 2 x operator[], compact() all same as before
```

```
bool ensureCapacity(int cap) {
      if (cap > MAXCAP) return false;
Assignment Project Exam Help
         if (_capacity < MAXCAP/2) {</pre>
           (_capacity *= 2)++;
     https://pow.coder.com
      Add.sWeChat powcoder
      return true:
```

```
bool insert(T value, int index) {
      if (index < 0) index = 0;
Assignment. Project Exam. Help
      if (!ensureCapacity(new_count)) return false;
      https://powcoder.com
        store[i] = store[i - 1];
           dal Weethat powcoder
      _count = new_count;
      return true;
```

```
return insert(value, _count);
Assignment Project Exam Help
      if (index < 0 || index > _count)
      https://bowcoder.com
        /* shifts elements, overwriting the removed: */
      for (int i = index + 1; i < _count; i++)</pre>
               VeChat powcoder
```

bool append(T value) {

The example above demonstrates:

Constant value template parameter (int MAXCAP);

## Assibefault argument for postant value template parameter Help

Instantiating this template:

- ExtendableArray<int, INT\_MAX>
- . Little Start a Platy smaller to be com
- ExtendableArray<int, 10>
- Compile Childers Extends 111> typo Wicax der

ExtendableArray<int> as the same type, but all other pairs of the instantiations above are different types!

```
Now the main function:
typedef ExtendableArray < char, 10 > TinyArray;
int main() {
   gnment, Project Exam Help
 for (char c = 'a'; c < 'i'; c++)
   arr.append(c);
   https://powcoder.com
 arr.insert('Y', 0);
 arr.insert('Z', 2);
 arArdde W;eChat powcoder
 arr.remove(8);
 return 0;
```

	Action	Result	Count	Cap.	Contents	
	append('a')	true	1	1	а

	remove(8)	true	8	10	Y,a,b,c,d,e,X,g	

#### Sorted Lists

Consider a class of data, for every two of which an ordering is defined (<, ==, >). We will implement a container that ensures Assinginment list of the left. Exam Help

- If sl is a newly created sorted list, then sl is empty
- sl.count() gives the number of data stored in sl
- intensification in the list
- sl.add(d) adds the value d into the list at an appropriate index so that the invariant above is maintained, and causes sl.count() to be incremented by 1

• if 0 <= i < sl.count(), then sl.removeAt(i) removes
the value at i and causes sl.count() to be decremented by
1</pre>

### Assignment of the part of the

Design choices for our implementation:

- hits por sl/count() < i then sl. get(i) returns pos size va pthows except of the sl. get(i)
- if 0 <= i < sl.count(), then sl.removeAt(i) removes the element stored at position i and then returns returns returns false, throws exception.

How can we quickly locate the index to insert a new value, in a list of pre-sorted data?

#### Binary Search

#### Task

Pick the middle value in the list, if new value < mid value, the new value should be inserted into the first half of the list; otherwise it should be inserted into the first half of the list; otherwise it should be inserted into the list is again a sorted list, the process can continue to halve the search space until a single location remains.

### Add WeChat powcoder

We only need to search for at most log(n) times, instead of n times (where n is the size of the list). This method also works if the task is to quickly find a value in the list, or check if a value is in the list.

This method is generally known as Binary Search.

Example: value (val) to insert is 8, and we have narrowed down the search space to between head (incl.) and tail (excl.):

it Project Exam Help get(m) < val, so set h = m + 1m = (h + t)/2h t m m = (h+t)/2m get(m) < val, so set h = m + 1h = t. location to insert val is found. 5 9

```
template < typename T, int MAXCAP = INT_MAX >
     class SortedList :
Assignment Project Exam Help
       typedef ExtendableArray<T> Base;
       inhttps://powcoder.com
          while (head < tail) {
            int mid = (head + tail) / 2;
            if ((* this) [mid] < value) head = mid + 1; //X
eddif ((* this) hat = value) head = mid + 1; //X
eddif ((* this) hat = value) head = mid + 1; //X
          return head;
```

         (value == (*this)[index])) return index;
   → Add WeChat powcoder
```

```
void print(SortedList < char > & sl) {
     cout << "{":
     if (sl.count() > 0) {
       cout << sl.get(0);
Assignment Project Exam Help
     cout << "}" << endl;
   https://powcoder.com
     SortedList < char > sl(10, '0');
     saAdd WeChat powcoder
     sl.add('e'); print(sl);
                             // {c,e}
     sl.add('a'); print(sl); // {a,c,e}
     sl.add('b'); print(sl); // {a,b,c,e}
     sl.add('d'); print(sl); // {a,b,c,d,e}
     sl.add('c'); print(sl); // {a,b,c,c,d,e}
```

```
cout << sl.indexOf('b') << endl;</pre>
 signment Project Exam Help
ssignment Proje
 cout << sl.get(7) << endl;</pre>
 couhttps://pow/coder.com")
                     // {a,c,c,d,e}
 print(sl);
 couAdd Wethat powcoder end;
```

Assignment Project ExamelHelp

https://powcoder.com

This example also demonstrated that:

print(sl);

- template classes can take advantage of inheritance
- uacher move sten a torpen wicen der parameter

// {a.c.c.d.e}

The SortedList class template is almost perfect, except when we use a custom class or struct:

. . .

```
Assignment Project Exam Help

: x(x), y(y) {}

https://powcoder.com

SortedList<Point> slp(10, Point(-1, -1));

/* Compile error:

Aidat Wie Charpowcoder

*/
```

To allow the consumer of this class template to provide different comparison operations for different instantiations, we can use a function template parameter.

```
template <typename T,
 int (*comp)(const T& a, const T& b),
 int MAXCAP = INT_MAX>
class SortedList :
  private ExtendableArray<T, MAXCAP> {
 ignment Project Exam Help
 int locate(T value) const {
   int head = 0, tail = count();
     int cp = comp((*this)[mid], value);
     if (cp < 0) head = mid + 1;
   Add: WeChat powcoder
   return head;
  ... // rest of template as before
};
```

```
struct Point {
    ... // as before
};
```

## Assignment Project Exam Help

```
int compareChar(const char& a, const char& b) {
    return a s.b/powcoder.com
int compareDouble(const double& a, const double& b) {
    return a < b ? -1 : a == b ? 0 : 1; }

int compareInt(a.x, b.x);
if (comp != 0) return comp;
    return compareInt(a.y, b.y);
}</pre>
```

```
int main() {
    SortedList < int, compareInt > isl;
    SortedList < char, compareChar > csl;
    SortedList < point, comparePoint > psl;
}
```

- · https://poweoder.com
- However, for every instantiation of SortedList we need to define an equality function
- Warse: Impst by these equality functions have the same body!
- We can combine these similar functions into a template (function template)

#### Function Templates

A function template is a blueprint from which multiple individual functions can be constructed.

ssignment Project Exam Help
Additionally, function template instantiation is cleverer: the compiler may be able to figure out the template arguments 

- the types of function arguments must be clear at compile time

Then we do not need to (but lan) specify the template arguments when using the function template.

Makes it possible to use template operators (e.g. operator<<). There is no syntax to specify template arguments for operators.

```
template <typename T>
int simpleCompare(const T& a, const T& b) {
 return a < b ? -1 : a == b ? 0 : 1: }
int main() {
 ignment Project Exam Help
   int x, y;
   Point(int _x = 0, int _y = 0) : x(_x), y(_y) {}
 http's://powcoder.com
       << simpleCompare < char > (x, y) << endl;</pre>
 // OUT: x vs y: -1
 //AndditWeetinat: powerder>
 // OUT: x vs y: -1
 cout << "p1.x vs p1.y: "
       << simpleCompare(p1.x, p1.y) << endl;
 // Implicit instantiation: simpleCompare < int >
 // OUT: p1.x vs p1.y: 0
```

Now that we have a function template, we can use it as the default argument for the comparison function in SortedList.

```
template <typename T>
Assignment Project Exam Help
                                       in the two of tw
                                                          int MAXCAP = INT MAX>
                                       class SortedList
                                                          Add Wechat powcoder
                                                          ... // everything same as before
                                       };
```

```
Assignment Project Exam Help

    // OUT: P[0.0]
   return 0;
 }
```

#### Default Template Arguments - Summary

# Assitemble default per constant values, and functions for lp

- All parameters without defaults should go before those with defaults.
- Temptate Sstantiating Word of Ince or Indents, from right to left, where defaults are provided.
- For a class template instantiation, the angled brackets cannot be omitted every fall parameters are provided with defaults.
   For example, using a class template with all defaults: template\_name<>

#### Look-up Tables

Let's see how we might implement a simple look-up table (or map) using templates.

# Assignment Project Exam Help insert(key: TKey, val: TValue): void get(key: TKey): TValue\* https://project Exam Help insert(key: TKey, val: TValue): void get(key: TKey): TValue\*

- insert: adds a mapping from key to val. If key exists then val overrides the previous data, does nothing, throw exception
- get. retrieves a pointer to the value associated with key.
  (Why use TValue\* instead of TValue or TValue&?)
- remove: removes the mapping where key is the key, if any, and returns whether such mapping existed before the removal.

```
template <typename TKey, typename TVal,
    int (*keyComp)(const TKey& a, const TKey& b)
    = simpleCompare>
class Map {
ssignment, Project, Exam Help
  struct KVP {
   https://powcoder.com
    KVP(TKey _key) : key(_key) {}
    KVP(TKey _key, TVal _val)
           WeChat powcoder
    static int comp(KVP* const& a, KVP* const& b) {
      return keyComp(a->key, b->key);
```

```
SortedList < KVP*, KVP::comp > base;
Assignment Project Exam Help
   publhttps://powcoder.com
     virtual ~Map() {
      for (int i = 0; i < base.count(); i++) {
Adde Weethat powcoder
```

```
void insert(TKey key, TVal val) {
       int idx = locate(key);
       if (idx == -1) base.add(new KVP(key, val));
       else base.get(idx)->val = val;
Assignment Project Exam Help
     TVal* get(TKey key) const {
       int idx = locate(key);
     https://powooder.com
     bool remove(TKey key) {
           d Weckhat powcoder
       delete base.get(idx);
       base.removeAt(idx); return true;
```

# Assignment: Project Example Help close relations between outer class and nested class.

- const keyword to the right of \*: constant pointer; reading the fip Sight to the WCOGET.COM
- Another way to implement in-terms-of relationships (see private inheritance): data member (composition).

#### Templates Summary

- Templates are blueprints of classes/functions. Compiler
- generates actual classes/functions by textual substitution. can provide default arguments to their parameters.
  - Class template instantiation is explicit; function template https://powcoder.com
  - Instantiated entities from the same template are equivalent (i.e. have the same type) if the arguments supplied are the \*Aedd WeChat powcoder
    Templates and inheritance can be pombined.

  - ADTs make heavy use of templates to avoid code repetition.
  - Java and C# Generics are the successors to C++ templates.
